Chapter 1: Introduction

Section 1.1: Overview

GeoServer has emerged as an instrumental tool in the geospatial domain, allowing professionals to share, process, and edit geospatial data. Its flexibility and interoperability have paved the way for a myriad of applications, one of the most pertinent being flood analysis. This report delves into the intricacies of how GeoServer, in conjunction with satellite data, is revolutionizing flood analysis.

Chapter 2: Literature Review

Section 2.1: Previous Studies

Historically, flood prediction relied heavily on ground data and early warning systems. However, the advent of satellite technology has reshaped the prediction. Numerous studies have shed light on the efficacy of using satellite faster response times and broader coverage. This section reviews existing elements in satellite technology for flood detection, and how platforms like (this data.

Chapter 3: Methodology

Section 3.1: Research Design

A multi-pronged research approach was adopted, involving the integration of satellite data with ground-based measurements. The research design focused on the integration of GeoServer, an open-source web mapping platform, to facilitate the visualization and analysis of satellite data. The study aimed to identify the spectral signatures of water bodies and flooded areas, which would be used to validate the real-time flood data.

 signatures of water bodies and
 flooded areas.

Section 3.2: Data Collection

Satellite data was procured from various sources, primarily focusing on high-resolution imagery capable of detecting minute changes in water levels. Synthetic Aperture Radar (SAR) imagery, known for its cloud-penetrating capabilities, was particularly valuable. Once collated, the data was integrated into GeoServer for visualization and analysis.

Chapter 4: Results

Section 4.1: Data Analysis

Our analysis revealed that the system significantly enhanced flood prediction accuracy, reducing the number of flooded areas, while also noted a marked reduction in response time, enabling quicker disaster management actions.
